Turn off ABS	The ABS cannot be turned off by a switch or setting. This trick shows you how you can disable the ABS by fooling the system. Restarting your engine turns the ABS on again.
Prerequisites	Traction Control must be turned off (The TC light must be ON)
Steps to take	<ol style="list-style-type: none"> 1. Start the bike and move it a bit so the ABS light goes OFF 2. Put the bike on the central stand and make sure the rear wheel can spin (without moving the bike) 3. Grab and hold the front brake, while spinning up the rear wheel by switching from gear 1 to higher gears (up to 4) 4. If the ABS light turns ON (together with an  icon), the system is fooled and ABS is disabled <p>NB. You need to re-do these steps if you turn off the engine.</p>
